

**Pregatirea suportului:** Suprafata lemnoasa trebuie sa fie bine pregatita inainte de vopsire. Lemnul trebuie sa fie uscat si desprafuit. Daca lucrati in aer liber, va recomandam sa alegeti o zi senina cu temperaturi de peste 18 grade Celsius. Lemnul trebuie sa nu contina substante grase si uleioase, in caz contrar, acesta trebuie degresat. In cazul efectuarii de reparatii si restaurari, trebuie indepartate cat mai bine posibil urmele din vechea vopsea.

**Slefuirea lemnului** crud se va face folosind granulatii graduale, ajungand ca ultima granulatie sa fie 150-180. Pentru aplicarea la pensula, se va alege una cu par sintetic care nu se umfla la contactul cu lacurile pe baza de apa. Pensula trebuie sa fie cat mai moale, ca sa nu lase urme la aplicare. Cantitatea aplicata difera de la caz la caz, in functie de gradul de absorbtie al esentelor de lemn tratate. Este indicat ca pentru obtinerea unei culori cat mai uniforme sa se aplice cantitati abundente, menite sa satureze fibra lemnului penetrand cat mai bine, dar nu in exces. Timpul de uscare recomandat este extrem de important deoarece influenteaza dramatic atat aderența primului strat de suport, cat si aderența straturilor între ele.

**Tehnologie:** Folosirea lacurilor pe baza de apa pentru finisarea suprafetelor lemnoase expuse la exterior a devenit o practica foarte raspandita datorita numeroaselor avantaje pe care aceasta le ofera - timpul rapid de aplicare si uscare, excelenta elasticitate a peliculei de lac dar si rezistenta impecabila la fluctuatii de temperatura, agenti atmosferici si nu in ultimul rand - impact redus asupra mediului inconjurator.
